

LunchMagnet

Problem

- You want to have a lunch with your friends but you don't know where they are
- You can call all of your friends one by one and **this takes time** and it would still involve guesswork

Architecture

- The application utilizes the phone's GPS receiver and Google Maps
- Java Web Service acts as a central information exchange

Solution

LunchMagnet - Location aware ad-hoc social networking service

- Invite your nearby friends over for lunch or any of other activity!
- See you and all your friends on the map!
- Receive invitations from your friends!
